

FINANCE OS

Business Plan

How the brokerage runs, scales and compounds.

Executive summary

Finance OS is the operating layer for a modern broking business ? capturing every enquiry, following up instantly, and nurturing clients to settlement and referral, automatically.

This plan outlines the operating model, the growth engine and the unit economics that make the business predictable.

Operating model

One system replaces the fragmented stack ? CRM, marketing, messaging, funnels and booking ? so the broker stays the trusted adviser while the system handles the chase.

Every workflow is tokenized and repeatable, which means the business runs the same way whether you are in the office or not.

Growth engine

Speed-to-lead, automated nurture and reactivation turn the same volume of enquiries into more settlements. Past clients are re-engaged on a schedule, lifting refinance and referral revenue.

The result is a pipeline you can forecast ? month by month, quarter by quarter.

Unit economics

Replace eight tools with one flat platform cost, then measure the lift in settlements per lead, hours saved per week, and lifetime value per client.
